NASA LEWIS RESEARCH CENTER

PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE

H*GCL

1.0 Introduction

H*GCL was contracted by Analex Corporation to conduct a Phase I site characterization of Disposal Area Three, located on the Plum Brook facility of the National Aeronautics and Space Administration Lewis Research Center (NASA LeRC), Sandusky, Ohio (Figure 1-1). Phase I of the site characterization was designed to examine the potential soil contamination, which may have resulted from the historic use of a fire training pit, and two burnable dumps located within an area collectively referred to as Disposal Area Three and to evaluate the potential impact on the quality of the upper aquifer.

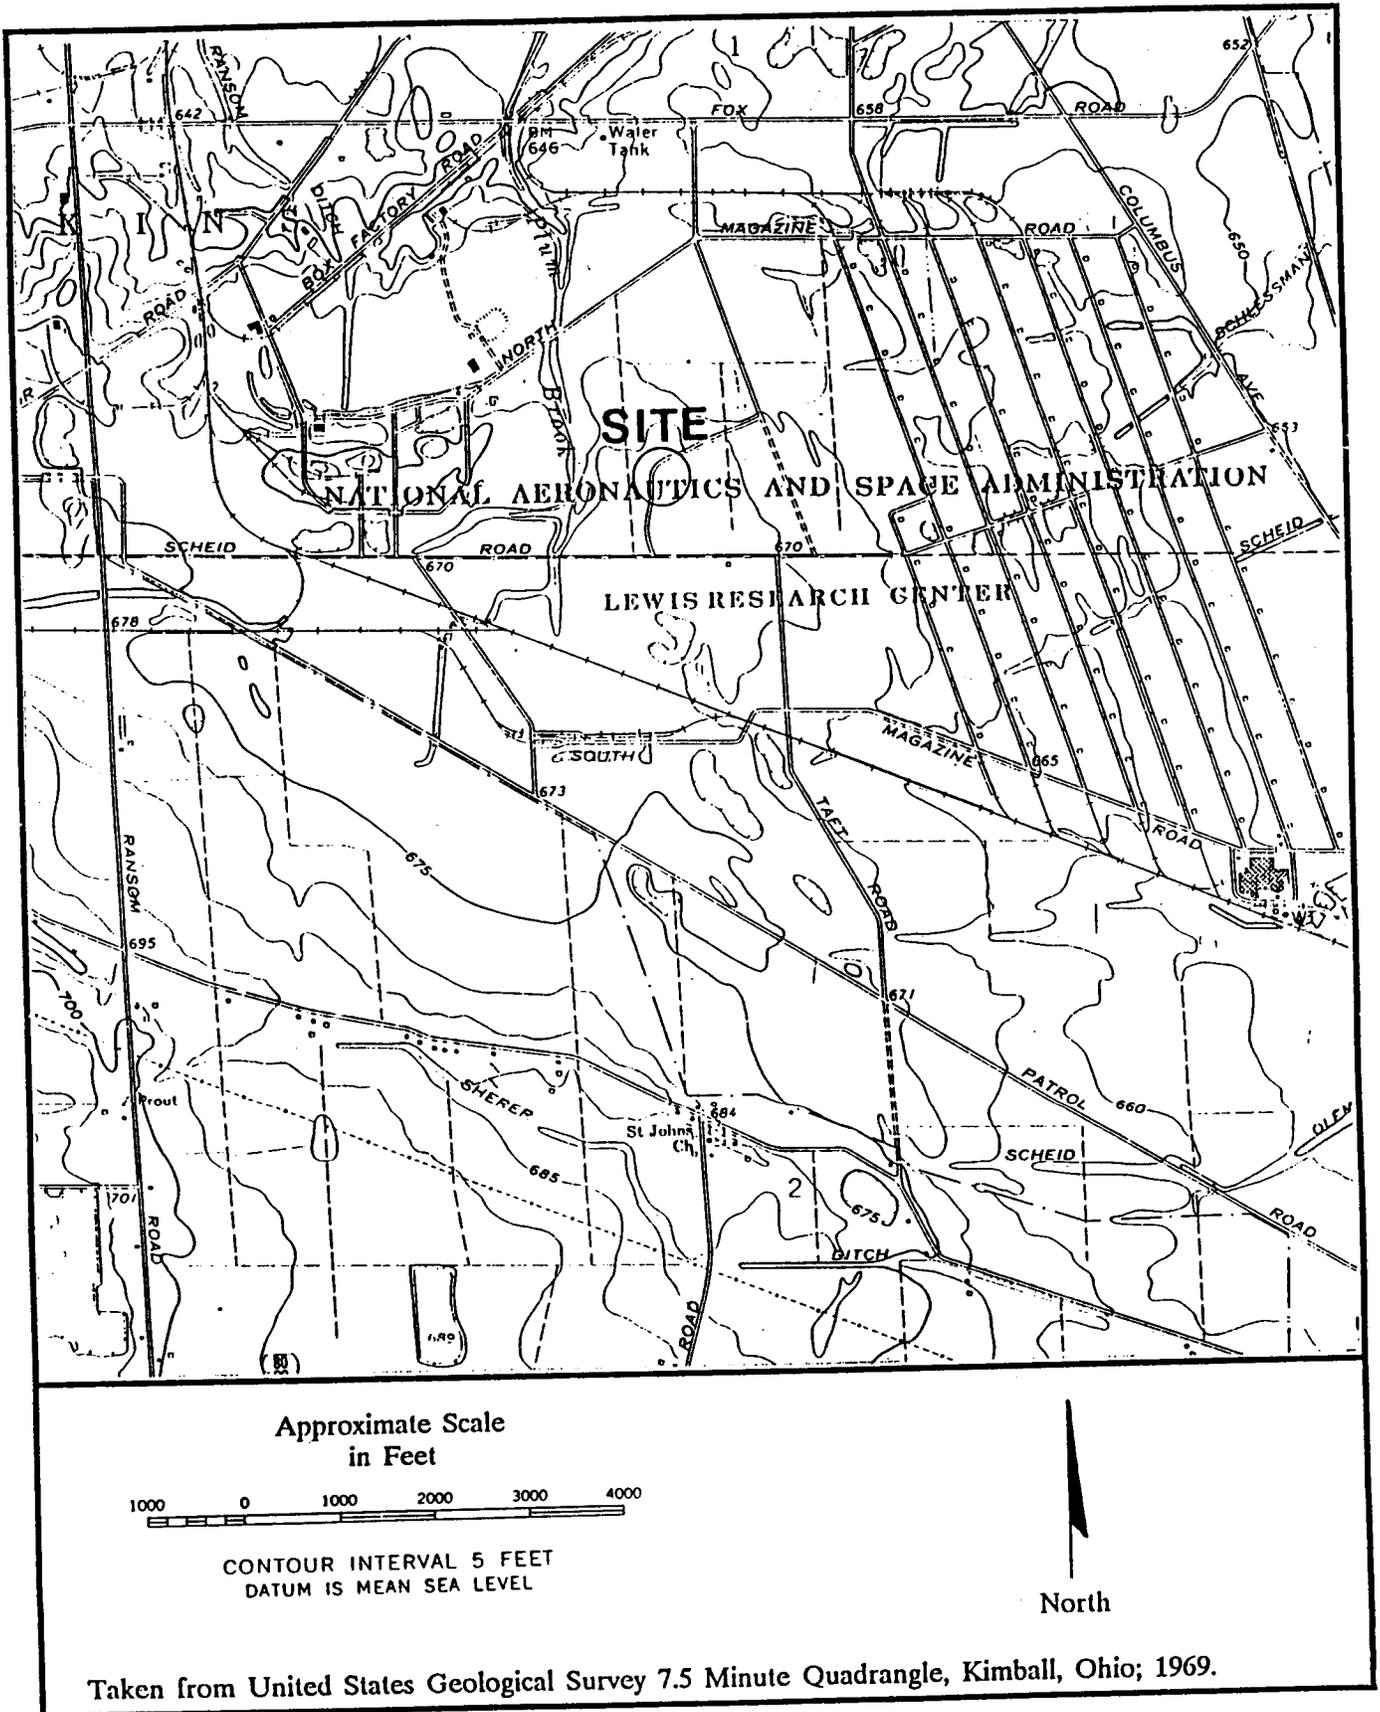

The Phase I site characterization included the following tasks to characterize the soils and the ground water underlying Disposal Area Three:

- A document search and interviews with facility personnel were conducted to determine the historic use of Disposal Area Three
- Nine soil borings were drilled, and soil samples were collected for both laboratory analysis and visual characterization
- Ground-water monitor wells were completed in four of the borings and ground-water samples were submitted for laboratory analysis

The compounds detected in the soil and ground water were compared to the following action levels or guidelines: State drinking water standards and Federal maximum contaminant levels (MCLs); Toxicity Characteristic Leaching Procedure (TCLP) standards; metal background concentration ranges for the eastern United States as presented in the USGS Professional Paper 1270 (1984); and proposed Resource Conservation and Recovery Act (RCRA) soil and ground-water action levels set forth in 55 FR 30798, July 27, 1990.

The soil at the site contains low levels of volatile organic compounds (VOCs), semi-volatile organic compounds, and total petroleum hydrocarbons (TPH); however, soil samples from the background location also exhibit low concentrations of four of the semivolatile organic compounds, TPH, and acetone. Ground water contains a very low concentration of benzene, total chromium, lead, silver, and zinc. Explosives, pesticides, and herbicides were not detected in the soil or ground-water samples submitted for analysis. Based on the information gathered during this site assessment and an evaluation of potential risks to human health, welfare, and the environment, H*GCL recommends that NASA pursue closure in place with limited resurfacing for this area; however, the open burning policy in

Figure 1-1
Site Location Map

**NASA LEWIS RESEARCH CENTER
PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE**

*H*GCL*

this area should be discontinued. No further site characterization or remediation activities are recommended.

The project objectives and site history are described in Section 2.0. Site characterization activities are described in Section 3.0. Section 4.0 presents a discussion of the analytical results, Section 5.0 presents analyses and conclusions and Section 6.0 presents the recommendations.

*H*GCL*

2.0 Project Objectives and Site History

2.1 Objectives of the Phase I Site Characterization

Based on the information presented in Analex's Request for Proposal, dated July 31, 1991, H*GCL originally prepared a Statement of Work (August 21, 1991) to investigate the fire training pit on the west side of Snake Road. However, background information obtained during research into the historical use of this property indicated that two burnable dumps located on the east side of Snake Road should also be investigated. One of these areas was used by NASA for burning combustible materials and the other area was used by the Army for burning explosive materials. Accordingly, the Work Plan for the site characterization was revised to incorporate the new information obtained during the historical document review task and was submitted for Analex/NASA approval on January 9, 1992. Initial field activities were conducted during the week of January 13, 1992, and one soil boring was completed on January 16, 1992. Information regarding depth to bedrock, as well as the large volume of soil required for all the requested analyses, subsequently prompted NASA, Analex, and H*GCL to revise the sampling methodology.

During a March 9, 1992 meeting at Plum Brook Station, attended by representatives from NASA, Analex and Bionetics (NASA subcontractors), and H*GCL, the following tasks presented in the January 9, 1992 Work Plan were modified:

- Characterization of Plum Brook surface water and sediment was deleted
- Metals analyses were limited to eight metals
- The proposed location for monitor well MW-3 was modified to assist in determining the direction of ground-water flow
- The soil sampling program was modified to determine the presence or absence of soil contaminants, not to define the extent of vertical and lateral contamination

The final objectives for Phase I of the investigation, as approved by Analex and NASA, are as follows:

- Determine the historic use of Disposal Area Three by both NASA and the Army

NASA LEWIS RESEARCH CENTER PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE

*H*GCL*

- Determine the types and concentrations of compounds present in the subsurface at Disposal Area Three
- Determine the impact, if any, of prior disposal activities on ground-water quality
- Determine the need for a Phase II Remedial Investigation and Baseline Risk Assessment

2.2 Site History

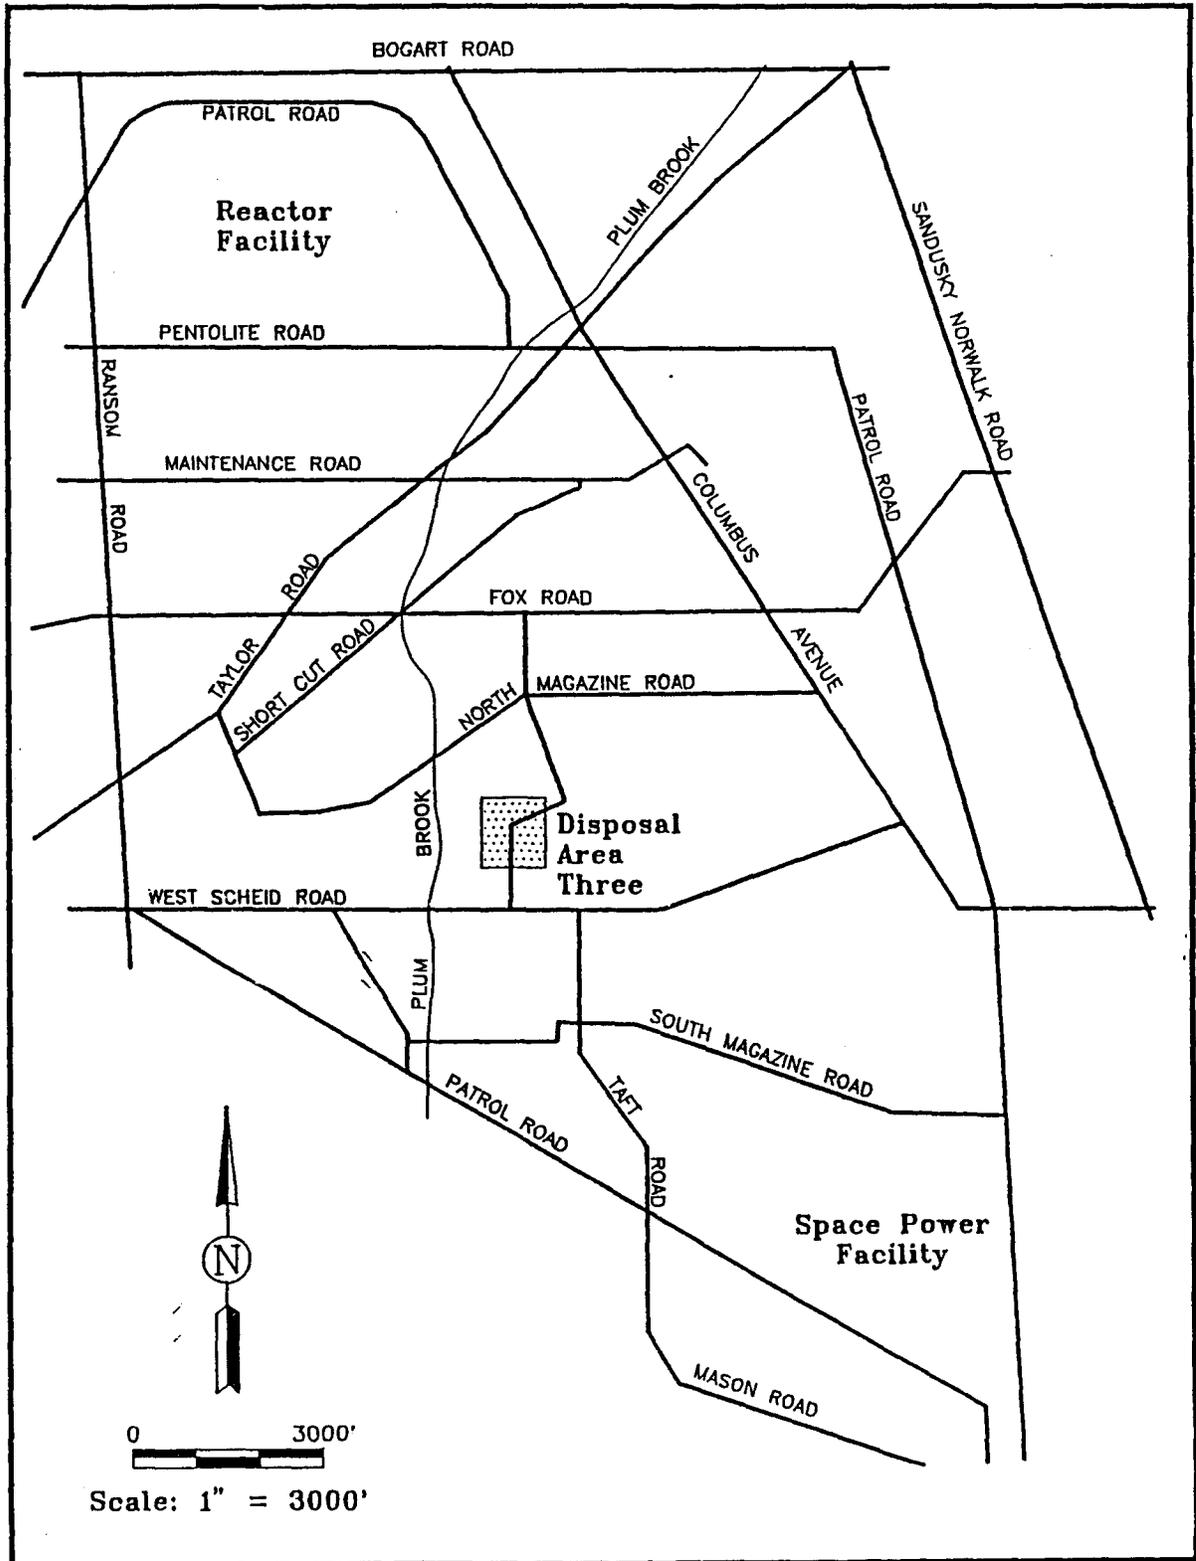

Plum Brook Station is a satellite operation of the Cleveland-based NASA LeRC. Plum Brook Station is located approximately 50 miles west of NASA LeRC, near Sandusky, Ohio, and it is primarily utilized as a research facility. Plum Brook Station covers approximately 6,400 acres south of Bogart Road and west of US 250 (Figure 2-1).

Use of the Plum Brook property dates back to 1941, when it was established by the U.S. Army as the Trojan Powder Plant. The Trojan Powder Plant manufactured weapons using trinitrofluorene (TNT), dinitrofluorene (DNT), and pentolite powders, acids, and related compounds. The facility was placed in standby condition from 1945 to 1946. During this period, the U.S. Army conducted decontamination and decommissioning of buildings and structures associated with the manufacturing of ordnance. Decontamination and decommissioning methods involved the removal and relocation of all explosives to an area east of Snake Road, where they were burned.

The National Advisory Committee for Aeronautics (NACA) leased 500 acres of the north portion of the site in 1956 to construct and operate a test reactor. In 1958 NACA was renamed NASA. In 1963, NASA acquired an additional 6,000 acres of the site for conducting aerospace research activities. Some of the major research operations conducted by NASA included a reactor facility, a space propulsion research facility (B2 Site Complex), space power facility (SPF), high energy rocket engine research facility, cryogenic propellant tank site (K Site), and the hypersonic tunnel facility (HTF). The reactor facility started operations in 1963 and was closed in 1973. In 1974, the Plum Brook facility was closed, although a skeleton crew remained on-site to conduct maintenance and oversight of the facility.

Figure 2-1

Plum Brook Station Facility Map

NASA LEWIS RESEARCH CENTER

PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE

H*GCL

In 1988, NASA started to generate work for the satellite facility and some buildings were brought back on-line. The four major aerospace operations which were reactivated include:

- **SPF** - This facility is a large vacuum tank used to test spacecraft and/or their subsystems and components in a simulated space environment.
- **K Site** - This facility tests propellant tank insulation systems and determines pressurizing gas requirements during propellant outflow.
- **B2 Site Complex** - This facility tests space vehicles and upper stage rocket engines in a simulated space environment.
- **HTF** - In this facility, air velocities and temperatures were created to simulate rocket flight speeds up to seven times the speed of sound and altitude conditions up to 120,000 feet.

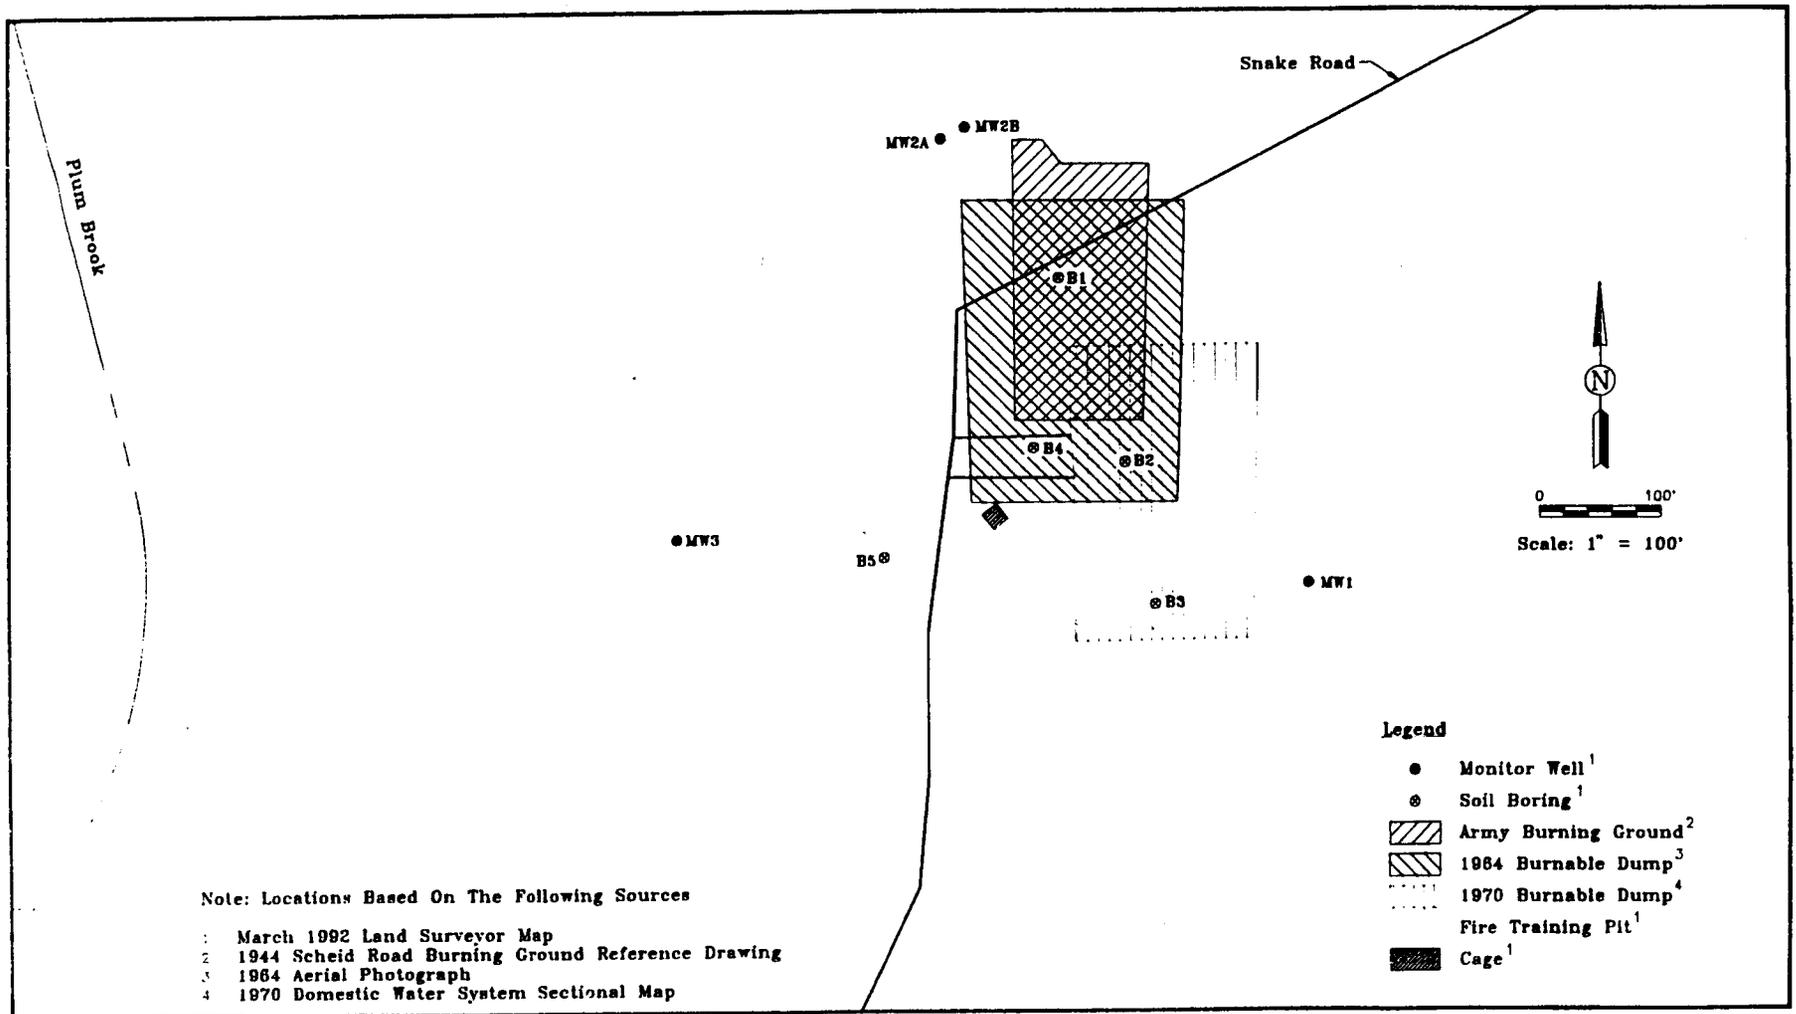

2.3 Disposal Area Three Historic Operations

H*GCL personnel conducted interviews with NASA employees as well as current and retired NASA on-site contractor personnel. The following descriptions are based on information contained in SAIC's "Plum Brook Station Preliminary Assessment" and obtained during H*GCL's site visits, interviews, and document review.

The area under investigation referred to as "Disposal Area Three" is located adjacent to Snake Road and consists of a fire training pit, an Army burnable dump and a burnable dump used under NASA operations.

The fire training pit, located on the west side of Snake Road, was constructed in the early 1960s and was used by on-site personnel during fire training exercises (Figure 2-2). Fire training exercises were conducted by partially filling the burn pit with water and waste oil and/or diesel fuel, which floated on the surface. The oil was ignited and the fire was extinguished with either dry powder or carbon dioxide. The fire training pit area was also used to extinguish materials (such as fuel filters and diesel fuel) that were ignited in small metal pans to simulate small scale fires. Waste oil and solvent were also reportedly in the pit and burned. The volumes and types of solvents and waste oils disposed of in this manner were not documented and this practice was typically in conjunction with on-site fire-fighting training conducted in the pit.

Figure 2-2
 Study Area Map
 Disposal Area Three

**NASA LEWIS RESEARCH CENTER
PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE**

H+GCL

In addition to fire training, the pit was also used on at least two occasions to dispose of solid and explosive waste. On one occasion, the pit was used to dispose of fuel oil filters. The filters were placed in the pit and set on fire in order to burn the fuel off. Remaining metal pieces associated with the filters were removed from the pit and disposed of as landfill waste. On the other occasion, in approximately 1971, the pit was used to dispose of a small amount of Class C explosives. Some metal pieces, not detonated during the process, remained after the explosives were burned and were removed from the pit for disposal as landfill waste.

An area on the east side of Snake Road was used by the Army in the period of 1941 to 1963 for the destruction (burning) of explosives during the decommissioning of the ordnance works. Based on the information collected to date, it is assumed that this area was contained by a dike around its perimeter. The volume of explosives destroyed in this area is unknown; however, hazardous substances destroyed at the burning grounds by the Army included materials contaminated with DNT, TNT, pentolite, and asbestos. Information relating to the Army's burnable dump is presented in the Draft Engineering Report for the Contamination Evaluation at the Former Plum Brook Ordnance Works Sandusky, Ohio (March 1990); this report was prepared for the Army by IT Corporation in March 1990.

The NASA burnable dump area, which includes a large wire cage, is located on the east side of Snake Road and was surrounded by a diked containment area, which is no longer present.

NASA continued to conduct decontamination and decommissioning at Plum Brook Station after the Army decommissioned the Trojan Powder Plant. Waste, generated during NASA's decontamination and decommissioning efforts that was contaminated or potentially contaminated with explosives or acids was also burned at Disposal Area Three. Other hazardous materials disposed of at the burning grounds by NASA may have included waste oils, solvents, and other chemicals. Common practice was to accumulate combustible/explosive waste in the burn pit and douse it with chemical waste prior to setting the waste pile on fire. The types and volumes of waste disposed in this manner were not documented. On May 14, 1973, a fire occurred at Disposal Area Three and the probable cause was stated to be either spontaneous combustion due to chemicals and oils dumped together or discarded smoking materials.

This area was also used during NASA's tenure for the destruction of combustible, non-contaminated solid waste (wood and paper-type debris). A wire cage, which remains on-site, was reportedly used to store combustible materials such as paper and cardboard prior to burning. It was also reported that metal, electrical equipment, wiring, rags, cardboard, and paper were burned in this area. The NASA burnable dump was used throughout the 1960s

NASA LEWIS RESEARCH CENTER PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE

*H*GCL*

and possibly to the mid-1970s; leftover unburned debris was periodically removed from the site. In the late 1970's, ash was removed from the burn pit and buried near Line Road 16 and North Magazine Road; the burn pit was then backfilled.

Figure 2-2 illustrates the approximate location of the fire training pit, two burnable dumps, and the current location of the wire cage. This figure illustrates the configuration of the dumps based on the following sources:

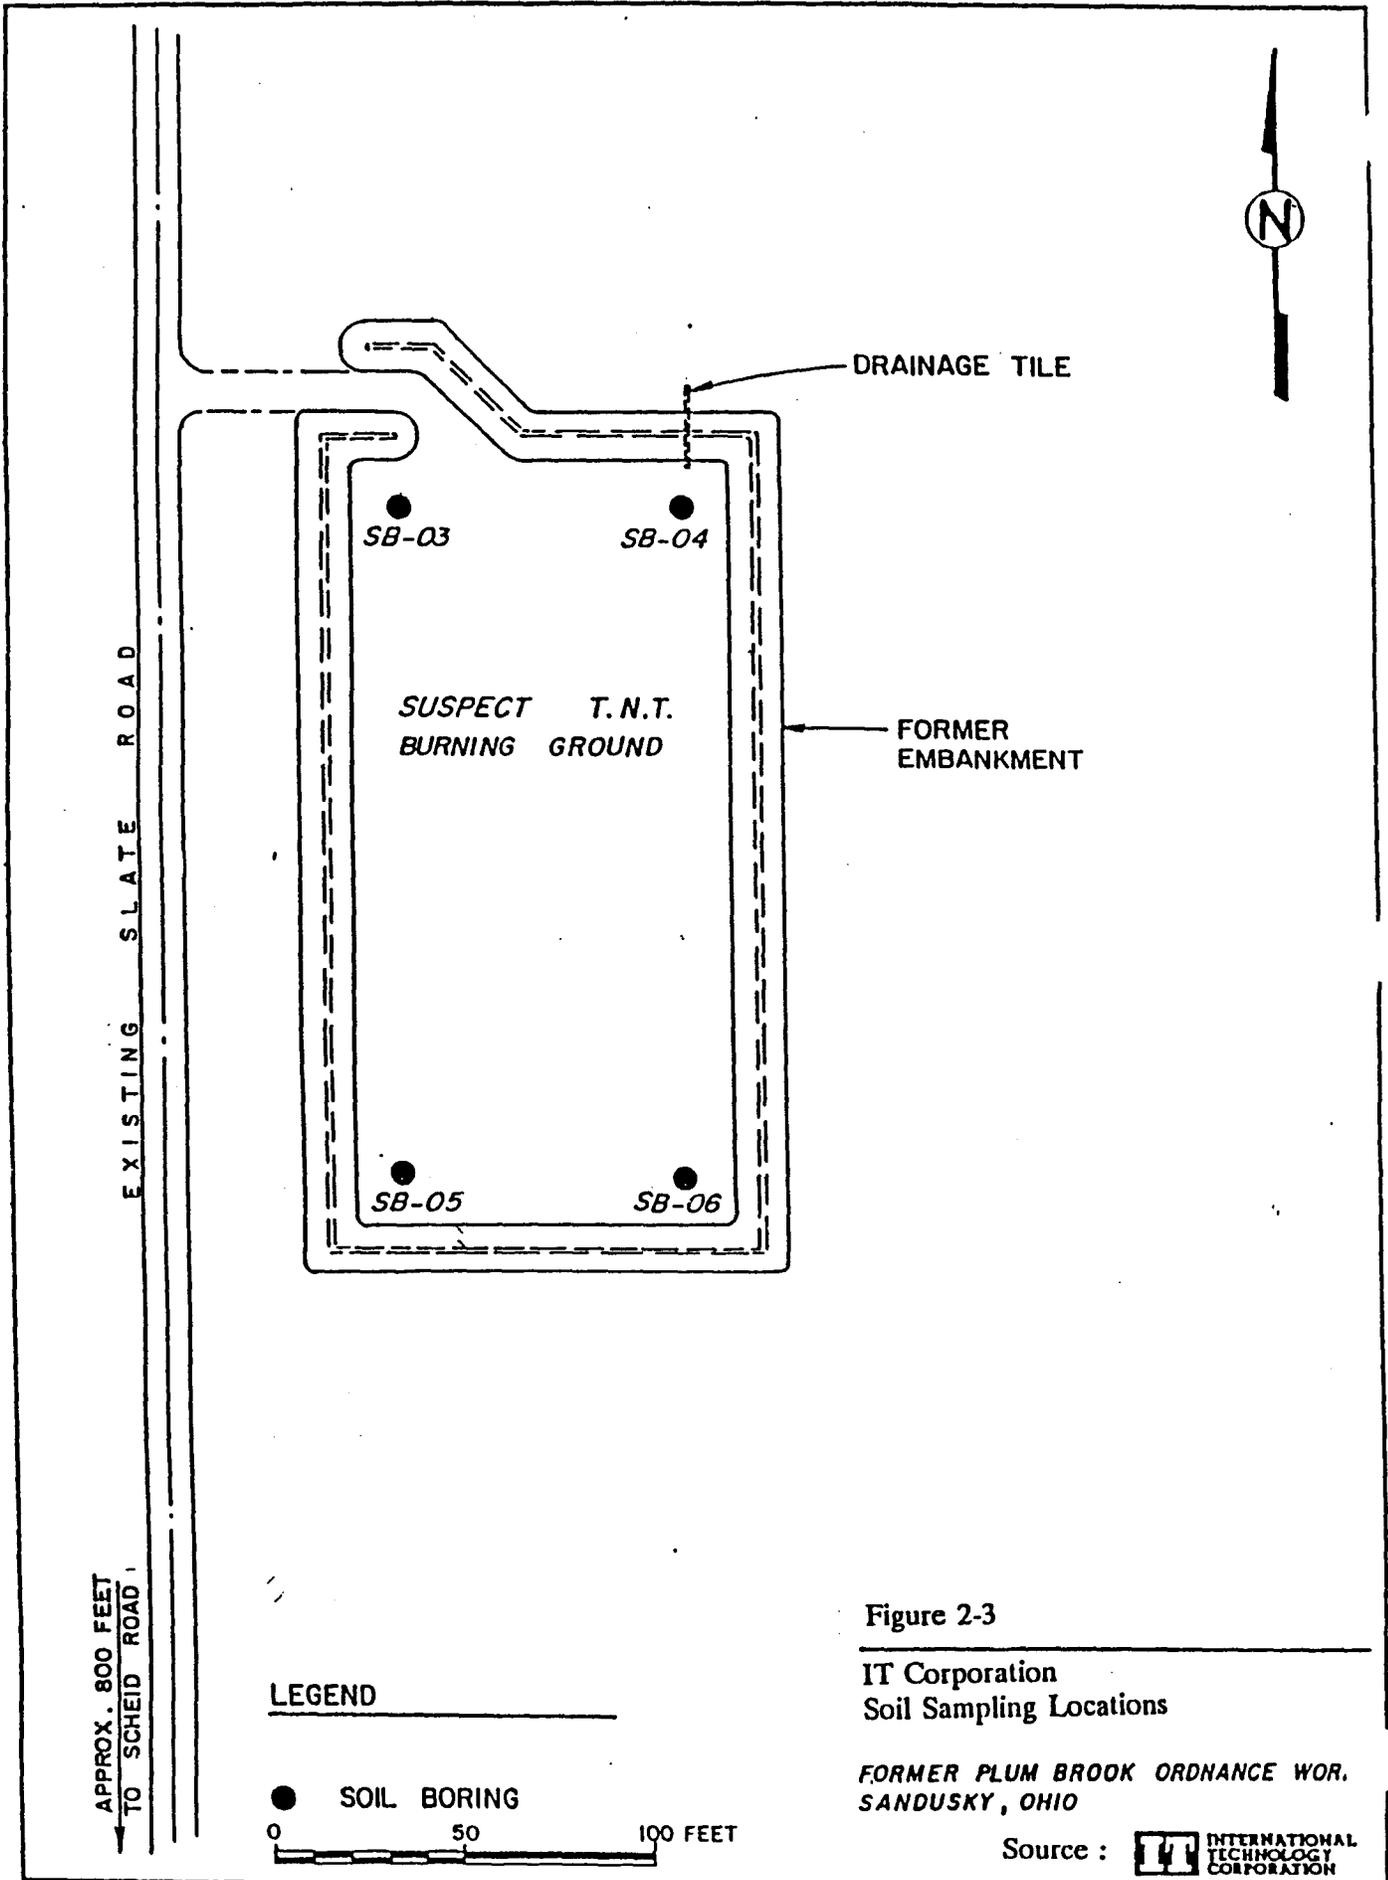

- 1964 aerial photo
- 1970 domestic water system sectional map
- 1944 Scheid Road Burning Ground reference drawing

Based on the information provided in the IT Corporation report, it is assumed that the Army's burnable area overlapped a portion of the 1964 burnable dump, which was located on the aerial photograph. The 1970 utility map location of the burnable dump, as depicted on Figure 2-2, may not be as accurate as the 1964 location since this area does not fully agree with NASA staff and subcontractor recollections. Some of the discrepancies may be attributed to the fact that Snake Road was previously oriented in a north/south direction and was relocated to its current orientation between 1964 and 1970. The Army's burnable dump and the 1964 burnable dump were situated east of the north/south aligned Snake Road. The 1970 burnable dump outline is located south of the new bend in Snake Road.

2.4 Previous Site Characterization

As of January 1991, there were over 17 ground-water monitor wells located at the Plum Brook site. Four wells were installed in late 1990 by IT Corporation during an investigation of the Army's disposal and decommissioning activities, and in early 1991, the remaining thirteen wells were installed by EBASCO to characterize leaking underground storage tanks at the nuclear reactor building, pump station, SPF, and the garage and vehicle maintenance area. None of these ground-water monitor wells are located within 3/4 of a mile of Disposal Area Three.

During IT Corporation's investigation of Disposal Area Three, four soil borings were installed in the vicinity of the area assumed to be the Army's burnable dump (Figure 2-3). Soil samples were collected from approximately the two to four foot depth interval and the samples were analyzed for volatile organic compounds (VOCs), semi-volatile organic

**NASA LEWIS RESEARCH CENTER
PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE**

*H*GCL*

compounds, metals, and explosive compounds. Table 2-1 presents a summary of the analytical results. A low concentration of 1,3,5-trinitrobenzene (0.093 mg/kg) was detected in soil boring SB-03. Volatile and semi-volatile compounds were also detected in the soil samples. Acetone was detected in all four soil samples with concentrations ranging from 65 $\mu\text{g}/\text{kg}$ to 4,300 $\mu\text{g}/\text{kg}$; methylene chloride was detected in samples SB03 and SB04 at concentrations of 10 $\mu\text{g}/\text{kg}$ and 8 $\mu\text{g}/\text{kg}$, respectively; and bis(2-ethylhexyl)phthalate was also detected in all four samples with concentrations ranging from 380 $\mu\text{g}/\text{kg}$ to 1,200 $\mu\text{g}/\text{kg}$. IT Corporation concluded that the presence of acetone in these samples may have been related to laboratory contamination. Since organic compounds were detected in IT Corporation soil samples, H*GCL did not want to designate any of IT Corporation's samples as background for this investigation. In addition, the exact location of the soil samples cannot be accurately determined based on the documentation provided in IT Corporation's report.

2.5 Soils, Geology, and Hydrology

Soils mapped by the Ohio Department of Natural Resources at Plum Brook Station are the Arkport-Galem association in the northern part of the station, and the Prout association in the southern part of the station. The Prout association occurs overlying shale bedrock and is a somewhat poorly drained soil with a heavy silt loam to silty clay loam subsoil. It has a moderately low permeability, estimated between 6.3 and 12 inches per hour, and thickness ranges from 20 inches to 60 inches.

Bedrock in northwestern Ohio consists of carbonates (limestone and dolomite) and clastics (sandstones and shales), and regionally dips to the northeast toward Lake Erie. Bedrock at Plum Brook Station consists of four Devonian-aged formations (listed oldest to youngest): the Columbus Limestone, the Delaware Limestone, the Plum Brook Shale/Prout Limestone and the Ohio Shale. Disposal Area Three is situated in the Plum Brook Shale, described as a blue-grey calcareous shale or mudstone. The depth to bedrock is highly variable across Plum Brook Station ranging from 2 to 12 feet for shales and from approximately 19 to 25 feet for limestone, according to previous soil borings and monitor well data.

Topography at Plum Brook Station is relatively level and slopes gently down toward Lake Erie to the north. The northern Ohio topography in general has been created and modified by glacial processes. Disposal Area Three is approximately 670 feet above mean sea level. The nearest body of standing surface water is an unnamed pond approximately 800 feet to the east of Disposal Area Three. The closest body of running surface water is Plum Brook, which is approximately 800 feet west of the site. Plum Brook is one of five streams that originates outside of Plum Brook Station, and eventually drains into Lake Erie, approximately 15 miles to the north.

Table 2-1

IT Corporation's Soil Sampling Results
Disposal Area Three

IT Sample Number	Volatile Organics	Semivolatile Organics	Nitroexplosives	Metals
SB-03	Acetone, 990 ppb Methylene Chloride, 10 ppb	Bis (2-ethylhexyl) phthalate, 380 ppb	1,3,5-Trinitrobenzene, 0.093 ppm	Barium, 31.6 ppm Chromium, 10 ppm Iron, 15,600 ppm Lead, 50 ppm Manganese, 71.3 ppm Sodium, 76 ppm
SB-04	Acetone, 65 ppb Methylene Chloride, 8 ppb	Bis (2-ethylhexyl) phthalate, 1,200 ppb	None Detected	Barium, 41.0 ppm Chromium, 7 ppm Iron, 11,000 ppm Lead, 16 ppm Manganese, 14.5 ppm Silver, 0.5 ppm Sodium, 45 ppm
SB-05	Acetone, 4,300 ppb	Bis (2-ethylhexyl) phthalate, 420 ppb	None Detected	Arsenic, 2 ppm Barium, 21.1 ppm Chromium, 4 ppm Iron, 4,940 ppm Lead, 9 ppm Manganese, 35.0 ppm Sodium, 32 ppm
SB-06	Acetone, 2,300 ppb	Bis (2-ethylhexyl) phthalate, 470 ppb	None Detected	Barium, 58.9 ppm Chromium, 6 ppm Iron, 6,420 ppm Lead, 16 ppm Manganese, 129 ppm Sodium, 80 ppm

ppb = $\mu\text{g}/\text{kg}$ ppm = mg/kg

**NASA LEWIS RESEARCH CENTER
PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE**

*H*GCL*

Local bedrock aquifers supply drinking water for parts of Erie County. The older limestone aquifers are highly productive, where yields of 100 to 500 gallons per minute may be developed. Municipal and industrial wells are located in the limestone aquifer in Sandusky, Ohio. The shales are poorly productive, where yields seldom exceed 3 gallons per minute. Domestic wells are located in the shale aquifer at approximate depths of 45 feet to 120 feet below the surface.

The surficial layer of glacial deposits may also contain discontinuous lenses of potentially water bearing sand and gravel. Shallow water-bearing sand lenses have been reported in the glacial deposits at Plum Brook Station at depths of less than 10 feet. Glacial till generally has a low permeability due to the high clay and silt content, making it a poor source of ground water. The lenses may be a bedrock recharge source. If vertical fractures are present, then the lenses are an eventual ground-water source for domestic wells.

**NASA LEWIS RESEARCH CENTER
PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE**

H⁺GCL

3.0 Phase I Site Characterization

3.1 Technical Approach for the Phase I Site Characterization

The technical approach for the Phase I Site Characterization consisted of the following subtasks:

- Research the historic use of Disposal Area Three to confirm the compounds potentially released at the site
- Complete a soil boring program to determine the presence of possible soil contamination at the burnable dumps and the fire training pit
- Complete a ground-water sampling program to determine the impact of the fire training pit and burnable dumps, if any, on the upper aquifer

The following sections present a description of the activities accomplished during each of these tasks.

3.2 Historical Document Search and Interviews

Prior to commencement of field activities, H⁺GCL reviewed all readily available site data pertinent to the Phase I activities and conducted interviews with employees from several key NASA departments, contractors, and tenants. Where possible, individuals selected for the interviews were those instrumental in the decision-making affecting the fate of several types of wastes at the Plum Brook facility, as well as those involved in the burning at Disposal Area Three.

The individuals interviewed were: Ray Ruffing, Don Young, Lynn Cherry, and Neil Casper of Sverdrup Technology Corporation; Bob Kanney and Amy Bower of NASA; Gene Freidt, retired, Teledyne; and Jack Ross, retired, Sverdrup.

Historical aerial photos (1958 and 1964) were reviewed to confirm that the confines of the pit did not migrate outside the area under investigation and that burn activities were concentrated in the same area. A review of available published geologic and hydrogeologic documents and local, county, and state records, was conducted. Site-specific assessments conducted by IT Corporation and Science Applications International Corporation (SAIC) were also reviewed. A complete list of references is presented in Section 7.0.

NASA LEWIS RESEARCH CENTER

PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE

H⁺GCL

3.3 Soil Boring Program

3.3.1 Soil Boring Locations

Field activities were initiated during the week of January 13, 1992. On January 16, 1992 boring B-1 was completed, however, due to inclement weather, the remaining field activities were postponed until the week of March 9, 1992.

A total of nine soil borings were installed in this area upon completion of field activities. Four of these borings were completed as monitor wells, and the remaining five were grouted after soil sampling was completed. The soil boring and well locations are shown on Figure 2-2. Borings B1, B2, and B4 were designed to characterize the Army's burnable dump area. Borings B3 and B2 were placed to characterize NASA's burnable dump area. Boring B5 was placed adjacent to the fire training pit to characterize the potential types of soil contamination that could be present as a result of fire training activities. MW-1 was assumed to be the background location for this area. MW-2A and MW-2B were used to aid in the delineation of the soil contamination from the Army's burnable dump and MW-3 was used to define the direction of ground-water flow. The elevations of the borings were surveyed by John Hancock and Associates and the locations of the borings are tied into NASA's coordinate system.

3.3.2 Soil Sampling and Analysis Procedures

The data collected during the initial drilling conducted in January 1992 was used to amend the initial Work Plan, dated January 9, 1992. For example, bedrock was encountered in B-1 at eight feet below ground surface, and an insufficient amount of soil was collected from the split spoons to obtain two complete sets of samples from the boring, as delineated in the January 9, 1992 Work Plan. Therefore, soil samples from B1 were collected and submitted for the designated analyses from the following intervals.

- 0-1 Foot Interval Total lead, mercury, and explosives
- 2-4 Foot Interval VOCs
- 4-8 Foot Interval Semi-volatile organic compounds
- 6-8 Foot Interval TPH, Polychlorinated Biphenyls (PCBs), pesticides, and herbicides

**NASA LEWIS RESEARCH CENTER
PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE**

*H*GCL*

This information was provided to Analex and NASA and was used to develop revised soil sampling procedures, which were implemented when the field activities were resumed on March 9, 1992. The revisions included:

- Collection of soil samples for field screening and possible VOC analysis from each split spoon
- Collection and submittal of composite samples for analysis from each boring
- Submittal for analysis of one VOC sample per boring, based on results of field screening

The soil samples were analyzed for VOCs, semi-volatile organic compounds, herbicides, pesticides, PCBs, total mercury and lead, trinitrotoluene (TNT), dinitrotoluene (DNT), Cyclotrimethylene trinitramine (RDX), Cyclotetramethylene tetranitramine (HMX), TCLP metals, total petroleum hydrocarbons reported as gasoline (TPH-(G)) and diesel (TPH-(D)). Table 3-1 presents a summary of the laboratory analytical methods used during this investigation.

The soil from all borings, with the exception of B-1, were composited over the entire borehole depth for all analyses except VOCs. One sample interval from each boring was submitted for VOC analysis based on the results of the field screening activities; for VOCs, the interval with the highest field reading was submitted for laboratory analysis.

The soil borings were drilled by advancing a string of hollow-stem augers. Soil samples were retrieved continuously utilizing a split spoon device until bedrock was encountered. A soil boring log was completed for each boring which describes the lithology and field observations. These logs are included in Appendix A.

After each split spoon sample was retrieved, the sample was split into three portions. First, a 4-oz jar for analysis of VOCs was filled with soil and held pending results of field screening. A second portion of the sample was placed in a "ziplock" bag, for field screening of VOCs using a photoionization detector (PID) with an 11.7 ev lamp. The bags were retained until the boring was completed; then, heated, manually agitated for approximately 30 seconds to promote disaggregation, and analyzed by piercing the bag with the sampling probe of the PID. VOC concentrations in the headspace vapors were recorded. The results of the preliminary field analysis were used to determine which sample interval was to be submitted for laboratory analyses of VOCs. The remaining portion of the soil sample was placed in a stainless steel bowl and composited with the remaining split-spoon samples

H⁺GCL

from that boring. After auger refusal was reached, the sample was thoroughly mixed, placed in the appropriate laboratory-cleaned jars, and kept at 4°C pending shipment to the laboratory.

H⁺GCL standard operating procedures for Chain-of-Custody were strictly adhered to during all sampling activities.

3.4 Ground-Water Characterization

3.4.1 *Ground-Water Monitor Well Locations*

Figure 2-2 illustrates the location of the ground-water monitor wells. H⁺GCL's ground-water monitor well, MW-1 was designated as a background well for Disposal Area Three. In the Work Plan dated January 9, 1992, H⁺GCL proposed to use existing on-site wells for background comparison; however, upon review of the analytical results obtained from the background well installed by IT Corporation, it became apparent that there may have been some acetone laboratory contamination in the groundwater sample. Therefore, H⁺GCL installed a background well specifically for this area at the location of MW-1 (Figure 2-2).

Monitor wells MW-2A and MW-2B are located adjacent to the NASA and Army burnable dumps. Evaluation of the ground water at this location is needed to determine the impact, if any, on ground-water quality as a result of the activities conducted at the burnable dump areas. Monitor wells MW-2A and MW-2B were installed as a well pair, MW-2A was screened from 12 feet to 22 feet and MW-2B was screened from 4.8 feet to 9.8 feet below grade. These wells were completed to investigate the presence of vertical ground-water flow gradients.

In H⁺GCL's January 9, 1992 Work Plan it was proposed that MW-3 be installed adjacent to the fire training pit to evaluate the potential impact on ground-water quality from this area. However, during the March 9, 1992 meeting between NASA, Analex, and H⁺GCL, it was agreed that this well location would be modified and MW-3 would be located closer to Plum Brook to aid in the determination of the ground-water flow direction at Disposal Area Three. However, the new location for MW-3 that was agreed upon is not directly downgradient from the area of concern.

NASA LEWIS RESEARCH CENTER PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE

H*GCL

3.4.2 Well Construction

The ground-water monitor wells were originally to be completed above the top of the competent shale using the hollow stem auger rig. However, weathered shale was present at a depth of 6.0 feet below grade and auger refusal was encountered at 8.0 feet below grade in boring B-1. Based on this information, the well installation procedures had to be modified to allow penetration of the bedrock, or the wells could not be completed with at least a 5-foot screen length. After consultation with Analex and NASA it was decided that the wells would be drilled using a hollow stem auger, and if bedrock could not be penetrated with the augers, then drilling would be completed using air rotary methods and the wells would be completed in the shale.

All of the wells with the exception of MW2A are screened in the unconsolidated sediments as well as the underlying shale; MW2A was screened entirely in the shale. The depth of the screened interval chosen for wells MW1, MW2B and MW3 was based on the observations made during drilling activities. Saturated materials appeared at approximately 5 to 6 feet below grade which coincided with the interface of the unconsolidated materials and the underlying shale bedrock. The well screens were placed at or slightly above the depth where the saturated materials were observed except for MW2A which was completed entirely in the shale.

The ground-water monitor wells were installed utilizing the hollow stem auger drilling method until bedrock was encountered, then the drilling method was switched to air rotary. From the depth of auger refusal the augers (12 3/4 inches in diameter) were left in place and the rotary trigone bit (6 inches in diameter) and drill rods were inserted through the augers to allow drilling activities to continue. This combination of drilling methods was necessary since the bedrock underlying the area, a competent shale, could not be penetrated using the hollow stem augers.

The monitor wells were constructed of stainless steel screen and casing to satisfy Ohio EPA requirements. The casing and screen was emplaced through the augers, and the augers were retracted during emplacement of the sand pack. The filter pack material extended from approximately 3.0 feet to 1.0 feet above the top of the screen due to the shallow depth to ground water. A bentonite seal was placed above the filter pack and the thickness of the seals ranged from approximately 3.0 feet to 1.0 feet. The remaining annulus of the borehole was grouted using a cement-bentonite grout, the thickness of the grout ranged from 2.0 feet to 7.0 feet depending on the depth of the top of the screen. Appendix B contains the lithologic logs and the well completion diagrams for the four monitor wells.

NASA LEWIS RESEARCH CENTER PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE

H*GCL

The wells were completed above grade and equipped with locking protective steel casing that was painted orange. A concrete pad centered around each well was also installed. The monitor wells were secured with locks that are keyed alike to prevent tampering or accidental contamination. The elevation of the pads and the top of the protective casings were surveyed by John Hancock and Associates of Sandusky, Ohio and the locations are tied into NASA's coordinate system. Photographs of field activities are included in Appendix C.

3.4.3 Ground-Water Development Sampling and Analysis

The ground-water monitor wells were developed after installation to ensure that a satisfactory hydraulic connection existed between the well and the screened formations and also to remove fine sediments from the gravel pack. Well development was accomplished using a bailer. During the development process, physical and chemical parameters, such as pH, specific conductance, and temperature were measured. Development continued until a minimum of five well volumes were removed or stabilization of pH, specific conductance, and temperature were achieved. Due to the presence of fine silts and sands underlying the site, the ground water is relatively turbid and the wells could not be developed until they were sediment free. No free product was observed during well development activities. The well development records were completed for each well and are presented in Appendix B.

Ground-water samples were collected from each well on March 14, 1992. The samples were analyzed for the compounds listed in Table 3-1.

3.5 Decontamination Procedures

All drilling and sampling equipment was steam-cleaned prior to commencement of drilling activities and the augers and drill rods were steam-cleaned between borings. Sampling equipment was also cleaned before and after sampling using the following procedures:

- Wash in potable water with a brush, removing soil deposits or sediment
- Wash in a soapy mixture of potable water and a laboratory detergent such as Alconox®
- Potable water rinse
- Methanol rinse

**NASA LEWIS RESEARCH CENTER
PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE**

*H*GCL*

- Air dry

3.6 Waste Generation and Storage

Development, purge and decontamination water, and soil cuttings generated during field activities were placed in 55-gallon drums, labeled, and stored on-site pending receipt of analytical results. This material was not sampled during the March field activities since the decontamination water and soil cuttings were frozen. During the week of April 20, 1992, the materials were sampled and submitted for laboratory analysis. Prior to disposal, the drummed waste was characterized in terms of ignitability, reactivity, corrosivity, RCRA toxicity, and the paint filter liquids test (for soil). The drummed material was not sampled for TNT, DNT, RDX, and HMX since these compounds were not detected in any soil ground-water samples obtained during the investigation.

The analytical results for the drummed material indicate that the waste is non-hazardous, and it will be removed for appropriate disposal in a local landfill. Appendix E includes a summary of the laboratory results as well as the analytical data. Autumn Technical Services, Inc. will be used for the transport and disposal and will select the landfill. H*GCL is awaiting receipt of the schedule for drum removal and disposal.

3.7 Quality Assurance/Quality Control

A field rinsate blank, a trip blank and a replicate sample were collected to evaluate quality assurance (QA)/quality control (QC). The field rinsate blank tested the field sampling and decontamination procedures and thus the overall accuracy of the analysis. To obtain a rinsate blank, a volume of distilled water was poured through the split spoon and then into the appropriate container for analysis. The rinsate blank was collected for all compounds except TPH. A rinsate blank was not collected during ground-water sampling because disposable bailers were used to collect the samples.

A trip blank for VOC analysis was provided by the laboratory to ensure that the sample containers were not contaminated while in transit from the laboratory to the site or while in storage at the site.

**NASA LEWIS RESEARCH CENTER
PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE**

*H*GCL*

The accuracy and precision of the laboratory was assessed by using a blind replicate sample. A replicate sample for all compounds, except TPH, was collected from MW-3 during ground-water sampling activities; this replicate sample was labeled MW-5, a non-existing well, for sampling identification purposes so that it was submitted as a "blind" sample to the laboratory.

**NASA LEWIS RESEARCH CENTER
PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE**

H⁺GCL

4.0 Analytical Results

4.1 Soil Samples

Soil samples were collected from nine boreholes and the samples were analyzed for VOCs, semi-volatile organic compounds, PCBs, pesticides, herbicides, TPH, TCLP metals, TNT, DNT, RDX, and HMX. Samples from all borings, except B-1, were composited for all parameters except VOCs. The samples submitted for VOC analyses were selected from the specific interval which exhibited the most elevated field screening concentrations; for B-1, samples were collected for VOC analyses from the depth interval of 2-4 feet. Tables 4-1 through 4-3 include a summary of the soil sampling results by boring; these tables also include notations assigned by the laboratory relating to QC notations. Explosives, pesticides, and herbicides were not detected in any of the soil samples analyzed during this field investigation. Appendix D includes a copy of the complete laboratory data.

4.1.1 Volatile Organic Compounds

Table 4-1 presents a summary of the VOC soil sampling results, which includes the depth interval sampled. Samples that were reanalyzed by the laboratory because the surrogate recovery results were not within specified QC limits are discussed in the text using the highest concentration reported on the laboratory data sheets; both concentrations are included on the table for reference.

Acetone was detected in very low concentrations (9 $\mu\text{g}/\text{kg}$ to 39 $\mu\text{g}/\text{kg}$) in all samples except the field QC samples. However, in four of the samples, acetone was also found in the associated laboratory blank (denoted by a B on the table). IT Corporation's sampling results also indicated the presence of acetone in this area, but H⁺GCL's acetone concentrations were much lower.

Methylene chloride was found in all samples including the QC samples. In addition, methylene chloride was found in all of the laboratory blanks, therefore, methylene chloride can be considered a remnant of laboratory contamination.

The remaining VOCs were sporadically detected in the soils. In boring B-2, 11 $\mu\text{g}/\text{kg}$ of 1,1-dichloroethane and 64 $\mu\text{g}/\text{kg}$ of 1,1,1-trichloroethane was detected at a depth of 4 to 6 feet. In MW-2B and MW-3, 2-butanone was detected at 4 $\mu\text{g}/\text{kg}$ and 6 $\mu\text{g}/\text{kg}$, respectively. Concentrations in both samples were reported by the laboratory as estimated (J) because

the concentrations were greater than zero but less than the quantitation limit¹ for that particular sample. In addition, 2-butanone was also found in the laboratory blank associated with the sample from MW-3. The trip blank was the only sample that contained chloroform (9 µg/kg) and an estimated concentration of 2 µg/kg of bromodichloromethane.

4.1.2 Semi-Volatile Organic Compounds

The results from the semi-volatile samples are presented in Table 4-2. Eight compounds were detected in one or more of the borings; however, all of these results are estimated because the concentrations are less than the sample³oring limit. Phenanthrene and 2-methylnaphthalene were detected in all borings, except B-1, and the concentrations ranged from 48 µg/kg to 180 µg/kg and 95 µg/kg to 450 µg/kg, respectively. Naphthalene was detected in five borings and ranged in concentrations from 56 µg/kg to 160 µg/kg. Pyrene, chrysene, benzo(b)fluoroanthene were detected in B-2 and B-4 but in concentrations less than 56 µg/kg. Bis(2-ethylhexyl)phthalate was detected in B-1 (220 µg/kg) and B-4 (43 µg/kg); IT Corporation detected higher concentrations of this compound in all four of their borings. Di-n-butylphthalate was detected in MW-1 at a concentration of 72 µg/kg, in the 4 foot to 8 foot interval of B1 at a concentration of 48 µg/kg, and in the composite sample of B4 at a concentration of 82 µg/kg.

4.1.3 Metals, PCB, and TPH Concentrations

Table 4-3 includes the analytical results for the metals, PCBs, and TPH analyses. The concentrations for metals, using the TCLP procedure, are all well below the RCRA thresholds for characteristic hazardous waste. Total mercury in soil ranged from less than 0.1 µg/kg to 0.25 mg/kg, and total lead concentrations ranged from 20 µg/kg to 272 mg/kg with only one sample exhibiting a concentration greater than 70 mg/kg. The sample from B-2 contained 980 µg/kg of PCB 1248 and an estimated concentration of 330 µg/kg of PCB 1260. Boring B-4 also contained an estimated concentration of PCB 1260 (100 µg/kg) in the composite sample. TPH(G) was detected in all soil samples, however, the concentrations were below 15 mg/kg. TPH(D) was only detected in the sample from MW-2B, at a concentration of 86 mg/kg.

¹ Quantitation limit is defined as the lowest concentration of an analyte that can be reliably quantified and is usually set at the concentration in the sample equivalent to the concentration of the lowest calibration standard analyzed for that analyte.

NASA LEWIS RESEARCH CENTER
PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE

*H*GCL*

TPH analyses were accomplished using a gas chromatograph (GC) with a flame ionization detector. In order to determine the amount of volatile organics (gasoline) or semi-volatile organics (diesel) present in each sample a series of standards are injected into the GC. The chromatograms generated during this calibration are used to determine calibration curves and response factors which are compared against the actual chromatograms from the samples. This comparison yields a concentration that is quantified as gasoline (volatile portion) or diesel (semi-volatile portion) and these concentrations are presented on Table 4-3.

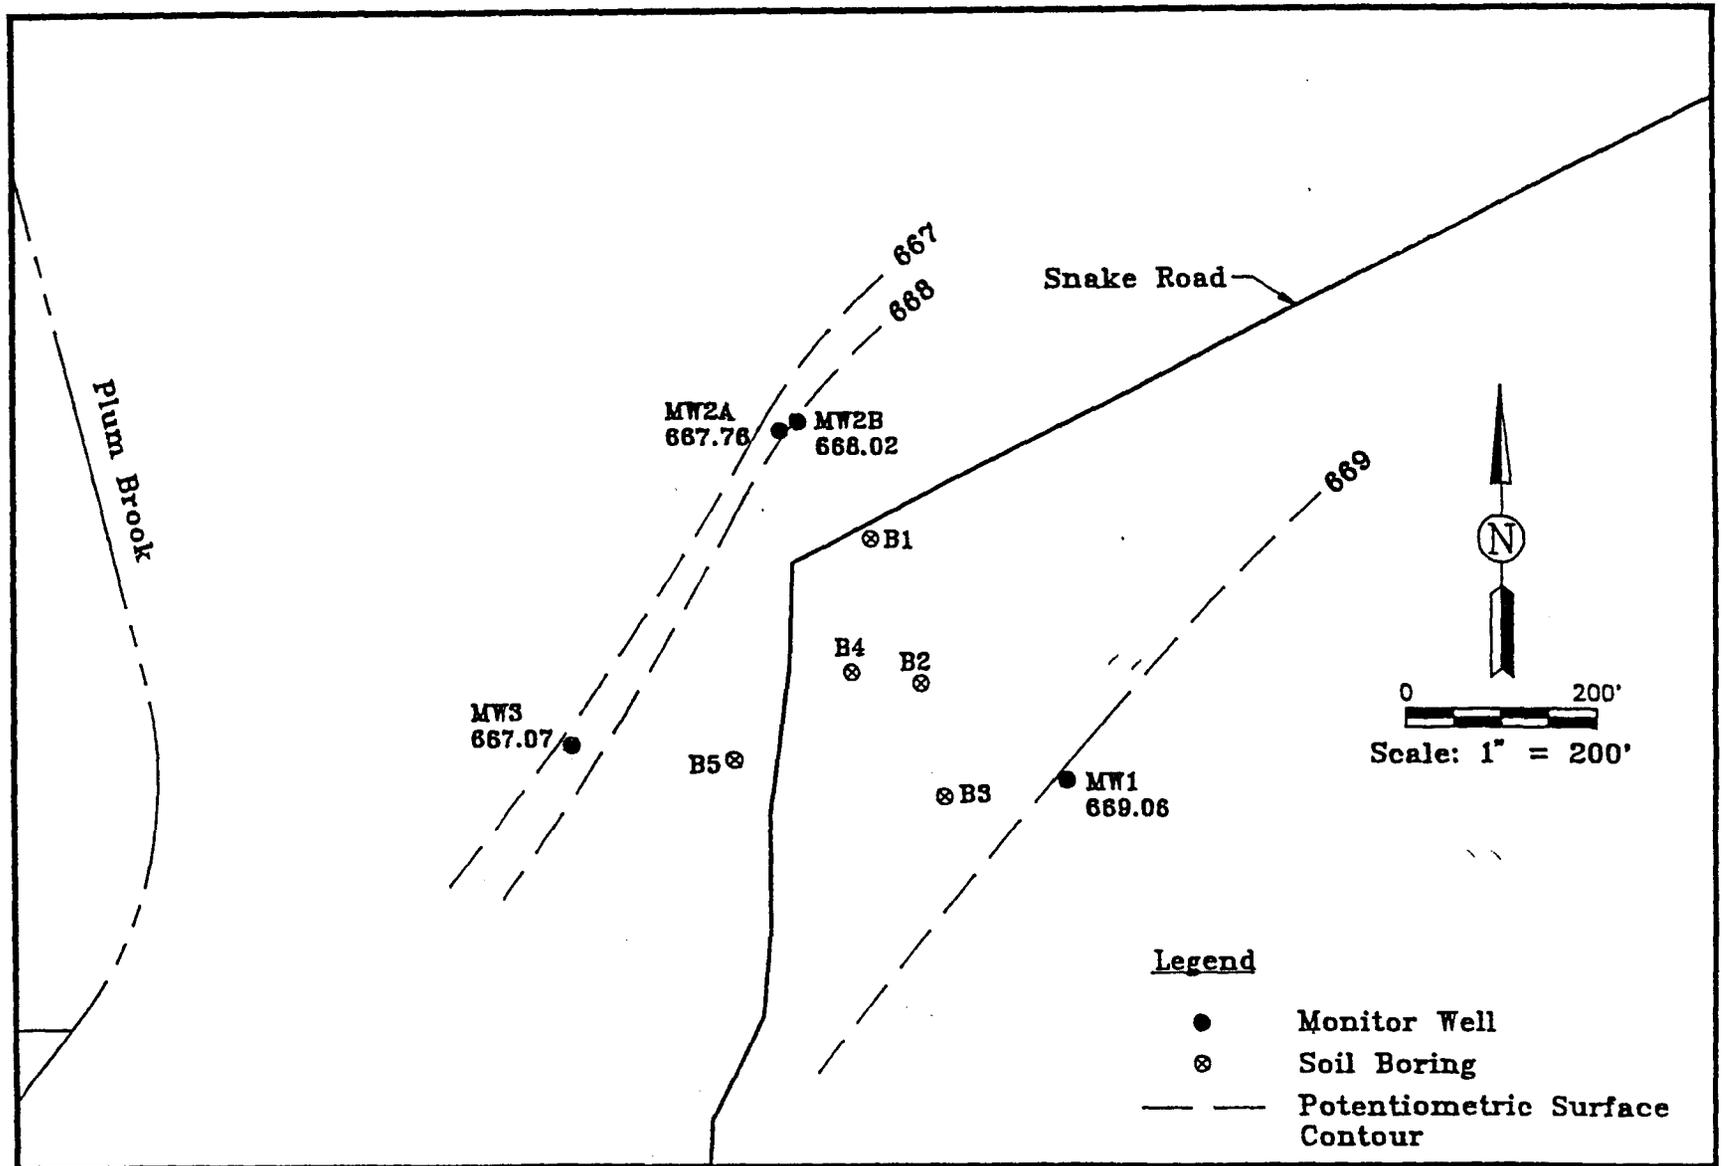

4.2 Ground-Water Samples

Figure 4-1 presents the potentiometric surface map that was prepared from data collected on March 14, 1992. As is shown on the map, ground-water flow is to the northwest towards Plum Brook. Designated as the background well for this area, MW-1, is indeed upgradient of Disposal Area Three. The ground water in the shale exhibits the characteristics of a confined aquifer (i.e., water levels that equilibrate above the top of the observed saturated materials). An evaluation of the water levels in all the wells in this area indicates that the wells monitor the same aquifer, since the water level elevation in MW-2A, which is completed in the shale, is comparable to the water level elevations in the other three wells, which are completed in both the unconsolidated materials and the shale. There appears to be only one aquifer in this area and the unconsolidated materials are part of this aquifer. The difference in ground-water elevations between MW-2A (deep) and MW-2B (shallow) indicates that there is a slight downward flow gradient (0.03) in this area, which may be due to recharge from the unconsolidated materials. However, the potentiometric surface at MW-2A indicates that this well is hydraulically connected to the uppermost aquifer.

A total of five ground-water samples were collected during this investigation. One sample was collected from each well and a replicate sample (MW-5) was collected from MW-3. Table 4-4 presents a summary of the laboratory data for these wells. Methylene chloride was detected in all samples at estimated concentrations ranging from 2 $\mu\text{g/L}$ to 5 $\mu\text{g/L}$. Methylene chloride was also found in the laboratory blanks, rendering these sample results invalid. Acetone was also found in all wells except MW-1, and the concentrations ranged from 9 $\mu\text{g/L}$ to 46 $\mu\text{g/L}$. Benzene was detected at an estimated concentration of 1 $\mu\text{g/L}$ in MW-2A. Low levels of total chromium and lead were detected in all samples, and silver and arsenic were each detected in only one well, MW-2B and MW-1 respectively. The trip blank was only analyzed for VOCs and methylene chloride was the only analyte detected (at an estimated concentration of 2 $\mu\text{g/L}$).

H*GCL

5.0 Analyses and Conclusions

The analytical results for the soil and ground-water samples were evaluated against published action levels to determine the need for further site characterization and/or remediation (Tables 4-1 through 4-4).

The compounds detected in the soil were compared to TCLP toxicity characteristics thresholds set forth in 40 C.F.R. Part 261; background metal concentrations as defined in U.S. Geological Survey Professional Paper 1270; proposed RCRA soil action levels as set forth in 55 FR 30798; and PCB Clean-up Standards set forth in 40 C.F.R. Part 761. The proposed soil action levels are health- and environment-based levels determined by EPA to be protective of human health and the environment.

The compounds detected in the ground water underlying Disposal Area Three were compared to State drinking water standards set forth in Ohio Administrative Code, 3745-54-94 and Federal maximum contaminant levels (MCLs) set forth in 40 C.F.R. Part 141.

Methylene chloride was detected in all of the samples as well as the laboratory blanks. Therefore, the presence of methylene chloride is likely attributed to laboratory contamination since the associated method blanks also contained methylene chloride. Acetone was also found to be a laboratory contaminant in four of the nine samples analyzed. Since IT Corporation also found acetone in the soils in this area during their investigation, it is likely that low levels of acetone are present in the subsurface.

Samples that were determined by the laboratory to be associated with laboratory contamination or compounds only detected in the QC samples (i.e., chloroform and bromodichloromethane in the trip blank) were not considered further.

5.1 Soil Constituents

In addition to acetone and methylene chloride, low levels of 1,1-dichloroethane, 1,1,1-trichloroethane, and 2-butanone were detected in three of the soil borings. In B2, 1,1-dichloroethane and 1,1,1-trichloroethane are present in B2 at concentrations of 11 $\mu\text{g}/\text{kg}$ and 64 $\mu\text{g}/\text{kg}$ respectively. Estimated concentrations of 2-butanone were found in the soils of MW-2B (4 $\mu\text{g}/\text{kg}$) and MW-3 (6 $\mu\text{g}/\text{kg}$); however, the concentration at MW-3 may be related to laboratory contamination. There are proposed RCRA action levels in 55 FR 30798 for three of these compounds: 1,1,1-trichloroethane (7,000 mg/kg), acetone (8,000

**NASA LEWIS RESEARCH CENTER
PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE**

H⁺GCL

mg/kg), and 2-butanone (4,000 mg/kg). Concentrations within Disposal Area Three are all well below these action levels.

Eight semi-volatile organic compounds were detected the soil samples; however, these compounds are present at levels below the sample limit and are therefore estimated values. Of the eight compounds detected, three of these compounds, 2-methylnaphthalene, phenanthrene, and naphthalene, were detected in more than half the samples. Soil samples obtained from B2 and B4 contained the greatest number of semi-volatile compounds. Of the semi-volatiles present, only bis(2-ethylhexyl)phthalate has a proposed RCRA soil action level of 50 mg/kg (50,000 µg/kg). This compound was detected in B1 at 220 µg/kg, a concentration well below the proposed RCRA action level.

The analytical results for TCLP metals in soils were below the RCRA TCLP thresholds for characterizing hazardous waste (Table 4-3). The total lead and mercury levels present in the soil (272 mg/kg maximum and 0.25 mg/kg maximum respectively) were within the reported background ranges for these constituents as reported in the U.S. Geological Survey Professional Paper 1270. In the eastern United States, the range for lead is less than 10 mg/kg to 300 mg/kg and the range for mercury is 0.01 mg/kg to 3.4 mg/kg.

The TPH(G) results ranged from 0.6 mg/kg to 14 mg/kg and TPH(D) concentrations were below detection limits with the exception of the soil sample from MW-2B (86 mg/kg). The recommended action level for petroleum based contamination in soils in Ohio is 1 mg/kg or background.

PCBs were detected in the soil at B2 and B4; however, the concentrations of 980 µg/kg and 100 µg/kg, respectively, are below EPA's recommended clean-up guideline of 10,000 µg/kg (10 ppm) for fresh PCB spills in a nonrestrictive area (40 C.F.R. § 761.120). The regulations require that during clean-up, soils be excavated to a depth of ten inches and replaced with clean soil (less than 1 ppm PCB). These two samples have PCB concentrations below the EPA clean-up guidelines as well as the criteria for clean backfill. The sample concentrations, however, exceed the proposed concentration of 90 µg/kg for RCRA proposed action levels (55 FR 30798).

Explosives, pesticides and herbicides were not detected in the soil samples submitted for laboratory analysis.

H*GCL

5.2 Ground-Water Constituents

Acetone was found in the ground water in all wells except MW-1. The concentrations of acetone encountered in the soils are of the same magnitude as the concentrations observed in the ground water. Based on this information, it is assumed that the concentrations in the ground water would not be expected to increase over time since the source area has similar concentrations. There are no MCLs for acetone in drinking water, but the proposed RCRA action level is 4,000 $\mu\text{g/L}$ and acetone in the ground-water samples are below this proposed RCRA action level.

Benzene was detected in one ground-water sample at an estimated concentration of 1 $\mu\text{g/L}$, which is below the Federal and State MCL of 5 $\mu\text{g/L}$. The four metals that were detected in the ground water are also below the State and Federal MCLs for drinking water.

The ground-water monitoring system that was installed in Disposal Area Three was constructed to monitor the uppermost aquifer. Wells MW1, MW2B, and MW3 are completed in both the unconsolidated sediments and the shale, and MW2A is completed in the shale. Since the two units are hydraulically connected, this system will detect the presence of contaminants in the unconsolidated materials. This premise is further supported by the analytical results from both the soil and ground water samples. There are low levels of contaminants present in the soil at these locations, and the analytical results from the ground-water sampling do not indicate the presence of significant contamination in the ground water underlying the site.

5.3 Risk Assessment

The presence of the compounds in the soil listed in Tables 4-1 through 4-3, and the compounds in the ground water listed in Table 4-4, were evaluated in terms of potential exposure pathways. Since the NASA Plum Brook Station is an access-controlled facility, exposure to ingestion, dermal contact, or inhalation by the general public is prevented. In addition, because the area has been decommissioned as an active burning ground and fire training area through removal of ash and unburned materials, and through regrading with fill, the potential for airborne emissions and/or direct contact with the compounds detected in the soil, by NASA employees or subcontractors, is also minimized. The greatest potential for exposure is through surface water and/or ground-water transport. An evaluation is presented below of the public health threat posed to water supplies by the presence of the detected compounds.

**NASA LEWIS RESEARCH CENTER
PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE**

*H*GCL*

5.3.1 Land Use, Population Exposure, and Drinking Water Supplies

Within a four mile radius of the Plum Brook Station, the land use is primarily residential and agricultural in nature. The cities and villages within this zone include Bogart, Sandusky, Bloomingville, Wilmes, and Kimball. Estimated population ranges from approximately 5,500 residences located within one to two miles of the facility to approximately 14,000 residences within three to four miles of the facility (SAIC, 3-27). City and rural water systems serve residences located north and east of Plum Brook Station. Residences south and west of Plum Brook utilize wells and/or cisterns. The Erie County Health Department does not permit surface water to be used as drinking water supplies.

Plum Brook obtains its drinking water supply from the City of Sandusky, which pumps water from Lake Erie for public, commercial, and industrial consumption.

Within a one-mile radius of the facility there are approximately 16 permitted drinking water well locations, most of which are located south of the Plum Brook Station property boundaries, upgradient of Disposal Area Three. Further, domestic wells are typically located in the shale aquifer at approximate depths of 45 feet to 120 feet.

From the ground-water analyses conducted at Disposal Area Three, there were no compounds detected in the upper aquifer which exceed established or proposed action levels requiring further site characterization or remediation to protect drinking water supplies.

5.3.2 Surface Water

Plum Brook is located within 800 feet of Disposal Area Three. Although the surface waters were not sampled, based upon the ground-water sampling and analysis results, the water quality of the stream is not likely affected by throughflow or baseflow. Storm water runoff may contain some compounds detected in the soil, but the concentrations reaching the stream are not likely to sufficiently deteriorate the water quality to constitute a threat to natural resources, including wildlife.

5.3.3 Soils

TPH and PCBs are the only compounds detected in the soil which exceed published action levels. Compounds detected in the soil for which there are no established action levels include 2-methylnaphthalene, phenanthrene, naphthalene, pyrene, chrysene, benzo(b)fluoranthene, and 1,1-dichloroethane. Table 5-1 presents an evaluation of the solubility and experimental data regarding potential risks to human health. Most of the

Table 5-1

Contaminant Hazard Evaluation

Compound	Solubility in Water	Human Hazards	Experimental Data	Comments
Total Petroleum Hydrocarbons	N/A	N/A	N/A	N/A
2-Methylnaphthalene	Insoluble	No listed human health hazards. When heated to decomposition, emits acrid smoke and fumes.	Oral-rat LDL: 5000 mg/kg	HR: 1
Phenanthrene	Practically Insoluble	Photosensitization of skin. Carcinogen. Poisoning by intravenous route. Moderately toxic by ingestion. When heated to decomposition, emits acrid smoke and irritating fumes.	N/A	HR: 3
Naphthalene ppb	Insoluble	Poisoning by ingestion of large doses, inhalation, or skin absorption. When heated to decomposition, emits acrid smoke and irritating fumes.	OSHA PEL: TWA = 10 ppm OSHA STEL: 15 ppm	HR: 3
Pyrene	Insoluble	Inhalation. Skin irritant. Human mutation. Possible carcinogen. When heated to decomposition, emits acrid smoke and irritating fumes.	OSHA PEL: TWA = 0.2 mg/m ³	HR: 3
Chrysene	Insoluble	Confirmed carcinogen with experimental carcinogenic, neoplastigenic, and tumorigenic data by skin contact. Human mutation data reported. When heated to decomposition, emits acrid smoke and irritating fumes.	OSHA PEL: 0.2 mg/m ³ ACGIH TLV: Suspected human carcinogen	HR: 3
Benzo(b)fluoranthene	Probably Insoluble	Confirmed carcinogen with experimental carcinogenic and tumorigenic data. Mutation data reported. When heated to decomposition, emits acrid smoke and irritating fumes.	N/A	HR: 3
1,1-Dichloroethane ppb found	Oily Liquid - ≈1 part/200 parts H ₂ O	Poison by ingestion. When heated to decomposition, emits highly toxic fumes of phosgene and chlorine.	OSHA PEL: TWA = <u>100</u> ppm	RCRA Waste Number U076 HR: 3
Aroclor 1248/1260	Insoluble	Suspected human carcinogen. Experimental reproductive effects. Moderately toxic by skin contact. When heated to decomposition, emits highly toxic fumes of chlorine.	NIOSH REL: TWA (PCBs) = 0.001 mg/m ³	HR: 3
Lead	N/A	Suspected carcinogen. Poison by ingestion. Moderately toxic by intraperitoneal route. When heated, emits highly toxic fumes.	OSHA PEL: TWA = 0.05 mg(Pb)/m ³	HR: 3

Notes: HR = Hazard Rating of High (3), Medium (2), or Low (1)
 PEL = Permissible Exposure Limit
 STEL = Short-Term Exposure Limit
 TWA = Time Weighted Average

OSHA = Occupational Safety and Health Administration

PHASE I SITE CHARACTERIZATION OF DISPOSAL AREA THREE

*H*GCL*

TION 6.0

SECTION 7.0

compounds, except benzo(b)fluoranthene and 1,1-dichloroethane, are relatively insoluble and, therefore, not likely to migrate substantially from Disposal Area Three. Of the two compounds which may be leached into ground water, the concentrations, 44 $\mu\text{g}/\text{kg}$ for benzo(b)fluoranthene and 11 $\mu\text{g}/\text{km}$ for 1,1-dichloroethane, are very low. Further, given the distance from the burn pit and dump to MW-3, where three compounds (2-methylnaphthalene, phenanthrene, and naphthalene) were detected in the soil, there is a likelihood that low concentrations of these compounds are present on an area-wide basis and are not solely attributed to the historic burning ground activities.

A majority of the compounds identified in the soils at the site could pose a health hazard if the compounds are heated to decomposition. (Table 5-1). Therefore, the practice of open burning at the site may impact human health and the environment by the generation of toxic or irritating fumes (chlorine or phosgene) and acrid smoke. Furthermore, the chemical reactions and decomposition products that could be generated during the burning activities are unknown since there are several compounds present in the soil. Therefore, we cannot recommend personnel protection or control to be employed based on the soil sampling conducted to date we cannot determine the exact depth or extent of PTO of these compounds. Consequently, H*GCL does not recommend that the open burning policy be continued in this area. Since we do not recommend open burning as an option and we cannot estimate what contaminants or fumes emitted during this practice; and H*GCL cannot offer an accurate opinion regarding the level of protection that would be required to adequately protect workers.

H⁺GCL

6.0 Recommendations

Since the presence of the compounds detected in the soil and ground water poses a very minor risk to public health and welfare and natural resources, H⁺GCL does not recommend any further site characterization or remediation. However, since all of the compounds presented in Table 5-1 have a high hazard ranking, as a precaution, the following actions are recommended for closure in place:

- The area should be posted and access restricted to "Authorized Personnel Only"
- Personnel authorized to access the area should be informed in writing of the potential exposures to air emissions and dermal contact if the surface cover is disturbed
- Written procedures should be developed before the area can be disturbed and restrictions should be recorded with the property deed and title
- Damage to the surface cover caused by the drilling operations should be repaired with relatively impermeable fill material
- The depression where the old fire training pit was located has been surveyed and should be filled in with impermeable material
- Open burning activities should not be allowed in this area.

Lanham, MD 20706

RE: Analytical Results

Dear Ms. Hodge:

Please find enclosed results concerning the analyses of the samples recently submitted by your firm. The Pertinent Information regarding these analyses is listed below.

Quote #: NY92-894
Project Name: NY2A3916 NASA PLUMBROOK
Matrix: Soil
Samples Received: 1/18/92
Sample Dates: 1/16,17/92

If you have any questions concerning these data, please contact Ms. Candace Steady, Project Manager, at (716) 691-2600 and refer to the I.D. number listed below. It has been our pleasure to provide Geoscience Consultants, Ltd. with Environmental Testing Services. We look forward to serving you in the future.

Sincerely,

RECRA ENVIRONMENTAL, INC.

Kenneth C. Malinowski, PhD
Vice President

ANALYTICAL RESULTS

Prepared For

Geoscience Consultants, Ltd.
4221 Forbes Boulevard, Suite 240
Lanham, Maryland 20706

Prepared By

Recra Environmental, Inc.
10 Hazelwood Drive, Suite 106
Amherst, New York 14228-2298

METHODOLOGIES

The specific methodologies employed in obtaining the enclosed analytical results are indicated on the specific data tables. The method numbers presented refer to one of the following U.S. Environmental Protection Agency references.

- * U.S. Environmental Protection Agency "Test Methods for Evaluating Solid Waste - Physical/Chemical Methods." Office of Solid Waste and Emergency Response. November 1986, SW-846, Third Edition.
- * The Toxicity Characteristic Leaching Procedure was performed in accordance with method 1311, 40 CFR, Appendix II to Part 261, June 1990.

COMMENTS

Comments pertain to data on one or all pages of this report.

The enclosed data has been reported utilizing data qualifiers (Q) as defined on the Organic and Inorganic Data Comment Pages.

Quality control analysis was performed on a batch basis. All results were within acceptable limits.

Results of the analysis of soils are corrected for moisture content and reported on a dry weight basis.

The dry weights (103°) were as follows:

METHOD	SAMPLE I.D.	PERCENT DRY (%)
8240	9201161345 B ₁ 2'-4'	74
8270	9201161355 B ₁ 4'-8'	88
8080	9201161410 B ₁ 6'-8'	87
8150	9201161410 B ₁ 6'-8'	87
8015	9201161410 B ₁ 6'-8'	92.1
METALS	9201171000 B ₁ SURFACE	76.8

TCLP matrix spike quality control analysis was performed on sample 9201161345 B₁ 2'-4'.

The measured values for sample 9201161345 B₁ 2'-4' on the enclosed TCLP data have been corrected for analytical bias based upon the matrix spike results from sample 9201161345 B₁ 2'-4' as required by the referenced TCLP protocol.

The TCLP extractions were performed on January 21, 1992.

Volatile Data

Volatile data was processed utilizing Hewlett Packard Autoquantitation. All compounds determined to be present by the computer-generated autoquantitation were subjected to a manual ion search for secondary and tertiary ions.

SEMIVOLATILE DATA

Semivolatile data was processed utilizing Hewlett Packard Autoquantitation. All compounds determined to be present by the computer-generated autoquantitation were subjected to a manual ion search for secondary and tertiary ions.

PCB/PESTICIDE AND HERBICIDE DATA

No deviations from protocol were observed during analyses.

Laboratory Name RECRA ENVIRONMENTAL, INC.

USEPA Defined Organic Data Qualifiers:

- U - Indicates compound was analyzed for but not detected.
- J - Indicates an estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed, or when the mass spectral data indicate the presence of a compound that meets the identification criteria but the result is less than the sample quantitation limit but greater than zero.
- C - This flag applies to pesticide results where the identification has been confirmed by GC/MS.
- B - This flag is used when the analyte is found in the associated blank as well as in the sample.
- E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument for that specific analysis.
- D - This flag identifies all compounds identified in an analysis at a secondary dilution factor.
- G - The TCLP Matrix Spike recovery was greater than the upper limit of the analytical method.
- L - The TCLP Matrix Spike recovery was lower than the lower limit of the analytical method.
- T - This flag is used when the analyte is found in the associated TCLP extraction as well as in the sample.

INORGANIC DATA COMMENT PAGE

Laboratory Name RECRA ENVIRONMENTAL, INC.

USEPA Defined Inorganic Data Qualifiers:

- B - Indicates a value greater than or equal to the instrument detection limit but less than the contract required detection limit.
- U - Indicates element was analyzed for but not detected. Report with the detection limit value (e.g., 100).
- E - Indicates a value estimated or not reported due to the presence of interference.
- S - Indicates value determined by Method of Standard Addition.
- N - Indicates spike sample recovery is not within control limits.
- * - Indicates duplicate analysis is not within control limits.
- + - Indicates the correlation coefficient for method of standard addition is less than 0.995.
- M - Indicates duplicate injection results exceeded control limits.
- W - Post digestion spike for Furnace AA analysis is out of control limits (85-115%), while sample absorbance is less than 50% of spike absorbance.
- G - The TCLP Matrix Spike recovery was greater than the upper limit of the analytical method.
- L - The TCLP Matrix Spike recovery was lower than the lower limit of the analytical method.

H + GCL, Inc.
4221 Forbes Boulevard, Suite 240
Lanham, MD 20706

RE: Analytical Results

Dear Ms. Nicholson:

Please find enclosed results concerning the analyses of the samples recently submitted by your firm. The Pertinent Information regarding these analyses is listed below.

Quote #: NY91-894
Project Name: Plumbrook
Matrix: Soil, Aqueous
Samples Received: 3/13/92
Sample Dates: 3/11,12/92

If you have any questions concerning these data, please contact Ms. Julie Calvert Project Manager, Customer Service at (716) 691-2600 and refer to the I.D. number listed below. It has been our pleasure to provide H + GCL, Inc. with Environmental Testing Services. We look forward to serving you in the future.

Sincerely,

RECRA ENVIRONMENTAL, INC.

Kenneth C. Malinowski / KPK

CASE NARRATIVE

ANALYTICAL RESULTS

Prepared For

H + GCL, Inc.
4221 Forbes Boulevard, Suite 240
Lanham, Maryland 20706

Prepared By

Recra Environmental, Inc.
10 Hazelwood Drive, Suite 106
Amherst, New York 14228-2298

METHODOLOGIES

The specific methodologies employed in obtaining the enclosed analytical results are indicated on the specific data table. The method numbers presented refer to the following U.S. Environmental Protection Agency reference.

- * U.S. Environmental Protection Agency "Test Methods for Evaluating Solid Waste - Physical/Chemical Methods." Office of Solid Waste and Emergency Response. November 1986, SW-846, Third Edition.
- * The Toxicity Characteristic Leaching Procedure was performed as per Method 1311, 40 CFR Appendix II to Part 261 June 1990.

COMMENTS

Comments pertain to data on one or all pages of this report.

The enclosed data has been reported utilizing USEPA data qualifiers (Q) as defined on the Organic and Inorganic Data Comment Pages.

The TCLP Matrix Spike quality analysis was performed on sample 9203101459MS. The measured values for the following samples have been corrected for analytical bias based upon the matrix spike results from sample 9203101459MS as required by the referenced TCLP protocol:

9203120957
9203111134
9203111121
9203121625

RECRA
ENVIRONMENTAL
INC.

Quantitation limits are not corrected for analytical bias.

The TCLP extractions were performed on March 16, 1992.

Results of the analysis of soil samples are corrected for moisture content and reported on a dry weight basis.

Quality control analyses were performed on a batch basis. All results were within quality control limits.

VOLATILE DATA

Volatile Method Blank VBLKW1 exhibits contamination by TCL compound Methylene Chloride. The level of contamination falls below protocol allowable limits, therefore the associated sample is both useable and compliant.

Volatile Method Blank VBLKS1 exhibits contamination by TCL compounds Methylene Chloride, Acetone and 2-Butanone. The levels of contamination fall below protocol allowable limits, therefore the associated samples are both useable and compliant.

Volatile Method Blank VBLKS2 exhibits contamination by TCL compounds Methylene Chloride and Acetone. The levels of contamination fall below protocol allowable limits, therefore the associated samples are both useable and compliant.

Sample 9203121549 required reanalysis due to the noncompliant recovery for Surrogate 1,2-Dichloroethane-d4. The reanalysis exhibited the same behavior indicating matrix interference.

SEMIVOLATILE DATA

No deviations from protocol were observed during analyses.

PESTICIDE/PCB DATA

No deviations from protocol were observed during analyses.

TPH 8015 DATA

No deviations from protocol were observed during analysis.

HERBICIDE DATA

No deviations from protocol were observed during analysis.

METAL DATA

No deviations from protocol were observed during analysis.

Lanhan, MD 20706

RE: Analytical Results

Dear Ms. Nicholson

Please find enclosed results concerning the analyses of the samples recently submitted by your firm. The Pertinent Information regarding these analyses is listed below.

Quote #: NY91-894
Project Name: Plumbrook
Matrix: Soil
Samples Received: 3/11/92
Sample Date: 3/7,10/92

If you have any questions concerning these data, please contact Ms. Julie Calvert Project Manager, Customer Service at (716) 691-2600 and refer to the I.D. number listed below. It has been our pleasure to provide H + GCL, Inc. with Environmental Testing Services. We look forward to serving you in the future.

Sincerely,

RECRA ENVIRONMENTAL, INC.

Kenneth C. Malinowski, PhD
Vice President

CASE NARRATIVE

ANALYTICAL RESULTS

Prepared For

H + GCL, Inc.
4221 Forbes Boulevard, Suite 240
Lanhan, Maryland 20706

Prepared By

Recra Environmental, Inc.
10 Hazelwood Drive, Suite 106
Amherst, New York 14228-2298

METHODOLOGIES

The specific methodologies employed in obtaining the enclosed analytical results are indicated on the specific data table. The method numbers presented refer to the following U.S. Environmental Protection Agency reference.

- * U.S. Environmental Protection Agency "Test Methods for Evaluating Solid Waste - Physical/Chemical Methods." Office of Solid Waste and Emergency Response. November 1986, SW-846, Third Edition.
- * The Toxicity Characteristic Leaching Procedure was performed as per Method 1311, 40 CFR Appendix II to Part 261 June 1990.

COMMENTS

Comments pertain to data on one or all pages of this report.

The enclosed data has been reported utilizing USEPA data qualifiers (Q) as defined on the Organic and Inorganic Data Comment Pages.

The TCLP Matrix Spike quality analysis was performed on sample 9203101459MS. The measured values for the following samples have been corrected for analytical bias based upon the matrix spike results from sample 9203101459MS as required by the referenced TCLP protocol:

9203071143
9203100927
9203101021
9203101235
9203101459

Quantitation limits are not corrected for analytical bias.

The TCLP extractions were performed on March 13, 1992.

Results of the analysis of soil samples are corrected for moisture content and reported on a dry weight basis.

Quality control analyses were performed on a batch basis. All results were within quality control limits.

VOLATILE DATA

Samples 9203071126, 9203100928, 9203101220 and 9203101453 had internal standard areas and/or surrogate recoveries outside of acceptance limits. These samples were reanalyzed with identical results thus demonstrating matrix interferences. Both analyses are submitted.

SEMIVOLATILE DATA

No deviations from protocol were observed during analyses.

PESTICIDE/PCB DATA

Samples 9203071143 and 9203101021 were initially analyzed at dilution factor of two (2) as a result of the matrix.

Sample 9203101235 was analyzed at a dilution factor of four (4) due to the concentration of Aroclors 1248 and 1260.

Sample 9203101459 was analyzed at a dilution factor of four (4) due to the concentration of Aroclor 1260.

TPH 8015 DATA

No deviations from protocol were observed during analysis.

HERBICIDE DATA

No deviations from protocol were observed during analysis.

METAL DATA

No deviations from protocol were observed during analysis.

Chemical and Environmental Analysis Services

April 4, 1992

Ms. Virginia Nicholson
H + GCL, Inc.
4221 Forbes Boulevard, Suite 240
Lanham, MD 20706

RE: Analytical Results

Dear Ms. Nicholson:

Please find enclosed results concerning the analyses of the samples recently submitted by your firm. The Pertinent Information regarding these analyses is listed below.

Quote #: NY91-894
Project Name: Plumbrook
Matrix: Aqueous
Samples Received: 3/16/92
Sample Date: 3/14/92

If you have any questions concerning these data, please contact Ms. Julie Calvert Project Manager, Customer Service at (716) 691-2600 and refer to the I.D. number listed below. It has been our pleasure to provide H + GCL, Inc. with Environmental Testing Services. We look forward to serving you in the future.

Sincerely,

RECRA ENVIRONMENTAL, INC.

Kenneth C. Malinowski, PhD
Vice President

CASE NARRATIVE

ANALYTICAL RESULTS

Prepared For

H + GCL, Inc.
4221 Forbes Boulevard, Suite 240
Lanham, Maryland 20706

Prepared By

Recra Environmental, Inc.
10 Hazelwood Drive, Suite 106
Amherst, New York 14228-2298

METHODOLOGIES

The specific methodologies employed in obtaining the enclosed analytical results are indicated on the specific data table. The method numbers presented refer to the following U.S. Environmental Protection Agency reference.

- * U.S. Environmental Protection Agency "Test Methods for Evaluating Solid Waste - Physical/Chemical Methods." Office of Solid Waste and Emergency Response. November 1986, SW-846, Third Edition.

COMMENTS

Comments pertain to data on one or all pages of this report.

The enclosed data has been reported utilizing USEPA data qualifiers (Q) as defined on the Organic and Inorganic Data Comment Pages.

Quality control analyses were performed on a batch basis. All results were within quality control limits.

VOLATILE DATA

Volatile Method Blank VBLKW1 exhibits contamination by TCL compound Methylene Chloride. The level of contamination falls below protocol allowable limits, therefore the associated data is both useable and compliant.

SEMIVOLATILE DATA

No deviations from protocol were observed during analyses.

PESTICIDE/PCB DATA

No deviations from protocol were observed during analyses.

TPH 8015 DATA

No deviations from protocol were observed during analysis.

HERBICIDE DATA

No deviations from protocol were observed during analysis.

METAL DATA

No deviations from protocol were observed during analysis.

RE: Analytical Results

Dear Ms. Nicholas:

Please find enclosed results concerning the analyses of the samples recently submitted by your firm. The Pertinent Information regarding these analyses is listed below:

Quote #: NY91-984
Matrix: Aqueous and Soil
Samples Received: 4/24/92
Sample Date: 4/22/92

If you have any questions concerning these data, please contact Ms. Julie Calvert, Project Manager, Customer Service at (716) 691-2600 and refer to the I.D. number listed below. It has been our pleasure to provide H + GCL with Environmental Testing Services. We look forward to serving you in the future.

Sincerely,

RECRA ENVIRONMENTAL, INC.

Deborah J. Kinecki /DKK

Deborah J. Kinecki,
Vice President

ANALYTICAL RESULTS

Prepared For

H + GCL
4221 Forbes Blvd.
Suite 240
Lanham, Maryland 20706

Prepared By

Recra Environmental, Inc.
10 Hazelwood Drive, Suite 106
Amherst, New York 14228-2298

METHODOLOGIES

The specific methodologies employed in obtaining the enclosed analytical results are indicated on the specific data tables. The method numbers presented refer to the following U.S. Environmental Protection Agency reference.

- * U.S. Environmental Protection Agency "Test Methods for Evaluating Solid Waste-Physical/Chemical Methods." Office of Solid Waste and Emergency Response. November 1986, SW-846, Third Edition.
- * The Toxicity Characteristic Leaching Procedure was performed in accordance with both method 1311 and modified method 1311, 40CFR, Appendix II to Part 261, June 1990.

COMMENTS

Comments pertain to data on one or all pages of this report.

The enclosed data has been reported utilizing data qualifiers (Q) as defined on the Organic and Inorganic Data Comment Pages.

TCLP Matrix spike quality control analysis was performed on sample 9204221240. The measured values for sample 9204221240 on the enclosed TCLP data have been corrected for analytical bias based upon the matrix spike results from sample 9204221240 as required by the referenced TCLP protocol.

Due to limited sample volumes provided by H + GCL, no TCLP bias correction spike could be designated for samples 9204221010, 9204221045 or 9204221135. Therefore, these samples have not been corrected for analytical bias as required by the referenced TCLP protocol.

Quantitation limits are not corrected for analytical bias.

TCLP Extraction Dates are as follows:

Sample: 9204221240	
Organics -	04/29/92
Volatiles and Metals -	04/28/92
Samples: 9204221010	Dates: 04/27/92
9204221045	04/27/92
9204221135	04/27/92

The TCLP Extractor Blank is associated with sample 9204221240, only. Since all other samples were aqueous, they were filtered only, not extracted; therefore, there is no TCLP Extractor Blank associated with these samples.

00

ORGANIC DATA COMMENT PAGE

Laboratory Name RECRA ENVIRONMENTAL, INC.

USEPA Defined Organic Data Qualifiers:

- U - Indicates compound was analyzed for but not detected.

- J - Indicates an estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed, or when the mass spectral data indicate the presence of a compound that meets the identification criteria but the result is less than the sample quantitation limit but greater than zero.

- C - This flag applies to pesticide results where the identification has been confirmed by GC/MS.

- B - This flag is used when the analyte is found in the associated blank as well as in the sample.

- E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument for that specific analysis.

- D - This flag identifies all compounds identified in an analysis at a secondary dilution factor.

- G - The TCLP Matrix Spike recovery was greater than the upper limit of the analytical method.

- L - The TCLP Matrix Spike recovery was lower than the lower limit of the analytical method.

- T - This flag is used when the analyte is found in the associated TCLP extraction as well as in the sample.

INORGANIC DATA COMMENT PAGE

Laboratory Name RECRA ENVIRONMENTAL, INC.

USEPA Defined Inorganic Data Qualifiers:

- B - Indicates a value greater than or equal to the instrument detection limit but less than the contract required detection limit.
- U - Indicates element was analyzed for but not detected. Report with the detection limit value (e.g., 100).
- E - Indicates a value estimated or not reported due to the presence of interference.
- S - Indicates value determined by Method of Standard Addition.
- N - Indicates spike sample recovery is not within control limits.
- * - Indicates duplicate analysis is not within control limits.
- + - Indicates the correlation coefficient for method of standard addition is less than 0.995.
- M - Indicates duplicate injection results exceeded control limits.
- W - Post digestion spike for Furnace AA analysis is out of control limits (85-115%), while sample absorbance is less than 50% of spike absorbance.
- G - The TCLP Matrix Spike recovery was greater than the upper limit of the analytical method.
- L - The TCLP Matrix Spike recovery was lower than the lower limit of the analytical method.
